

DC Current Sensor CYCT01-xnS3

The **CYCT01-xnS3** DC current sensor/transducer works according Photoelectrical Induction and is designed for applications to measurement and monitoring of DC current. The output signal (DC voltage or current) of this transducer is proportional to the input DC current. They are suitable for measurements and long time monitoring of DC currents and can applied to power supply management, DC motor drivers, battery chargers and systems etc.

Wiring of Terminals for OC Frequency Output (only for power supply +12V, +15V and +24V):

The value of the pull-up resistor R should be selected in order to get a current of 4-5mA flowing through the pull-up resistor. For instance the pull-up resistor is $24V/4.5mA=5.3k\Omega$ if you use a power supply +24VDC.

Recommended value of the pull-up resistor R

Power supply	+12V	+15V	+24V
Pull-up resistor R	2.6k Ω	3.3k Ω	5.3k Ω

Applications:

- Power supply management
- DC motor drives
- Battery chargers and systems
- Mobile applications.

Notice:

- If the input signal is bi-directional DC or pulse DC, please give a remark in your order.
- This sensor works on three isolations principle therefore the output signal and the power source may not be grounded in common.
- If the input current is higher than 1A, it is necessary to connect terminals 1&2 and terminals 3&4 in parallel in order to reduce the input resistance at the input terminals.
